

Population status of the Boreal felt lichen (*Erioderma pedicellatum*) and Vole ears lichen (*Erioderma mollissimum*) in Nova Scotia, Canada

Authors: Brad Toms¹

¹*Mersey Tobeatic Research Institute, Kempt, Nova Scotia, Canada.*

Known Boreal felt lichen (*Erioderma pedicellatum*) and Vole ears lichen (*Erioderma mollissimum*) thalli were monitored for survivorship, grazing, necrosis, health, and other threats from 2002 to 2021. In 2021 post-mortems were conducted for each host tree known to no longer host any lichens. The results of post-mortems are summarized for each species along with range maps of extant and extirpated host trees and a summary of the population status.

Keywords: lichens, species at risk, climate change, monitoring

Presentation type: poster
